nod Stellar mainnet

HackMeridian 2026 · Genesis · Stellar Composed

Give your AI an allowance.

Small stuff, it just pays. Big stuff needs your nod.

Live on Stellar mainnet `trynod.si` sandbox: `testnet.trynod.si`

IN YOUR WALLET

9.90

USDC · Personal · mainnet

CLAUDE MAY SPEND

2.90

of 5.00 USDC, until tomorrow 12:00 UTC

5.00 USDC to Bob

Claude asked for dinner · 2.90 left

Needs your nod

WHY NOD

Apps are becoming conversations. Wallets have to follow.

APPROVE EVERY CALL

The agent stops at every checkout.

A paid API call or paying a friend back waits for you, so the AI is no longer doing the task.

HAND OVER THE BALANCE

A card or a key gives it everything.

No limit and no expiry, and nobody trusts an AI with the whole balance.

> **“One allowance per AI app, on your own Stellar account. Inside it, it pays. Past it, your passkey.”**
>
> Nod's answer, in the chat where the AI already works: cards with MCP Apps, notices with MCP Events

THE PRODUCT

One number. Inside it, it pays. Past it, it asks.

YOU SET ONE NUMBER

Add Nod to Claude, or any MCP app, with one URL. Each AI app gets one allowance on your Stellar account: 5 USDC until tomorrow.

Inside the allowance, it just pays.

Paid APIs over x402 and people by name. Claude's own key signs; the account checks the limit.

```
0.10 · market brief
2.00 · Alice → 2.90 left
```

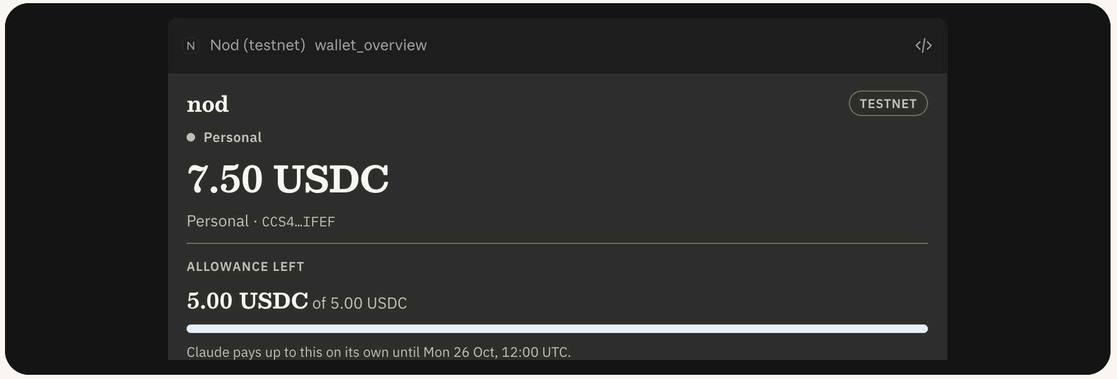

Past it, your nod. Every time.

Claude hands you a link. You see who, how much and which app asked; your passkey signs that payment, any amount.

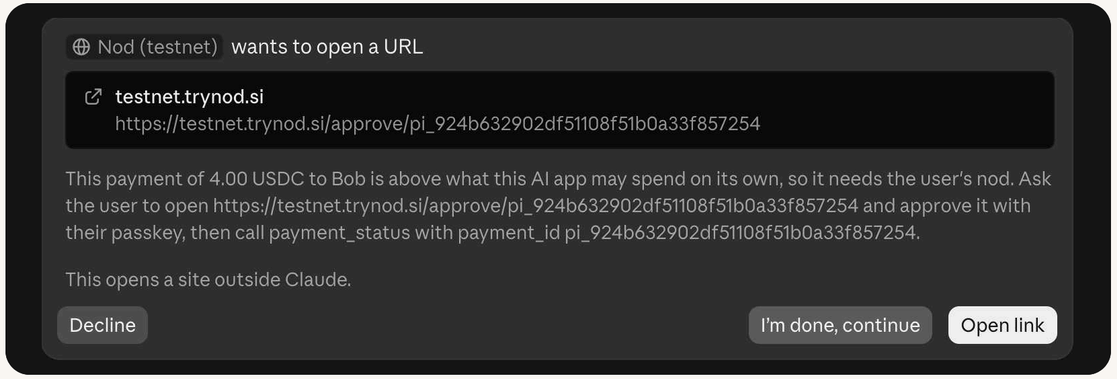

```
5.00 · Bob, dinner
passkey → paid
```

PRODUCT DESIGN · IN REAL HOSTS

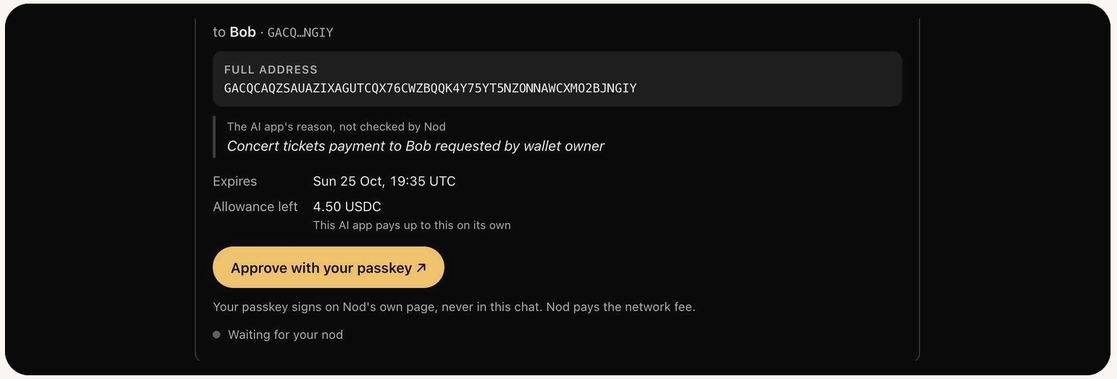

In the chat: claude.ai, ChatGPT and Goblin.

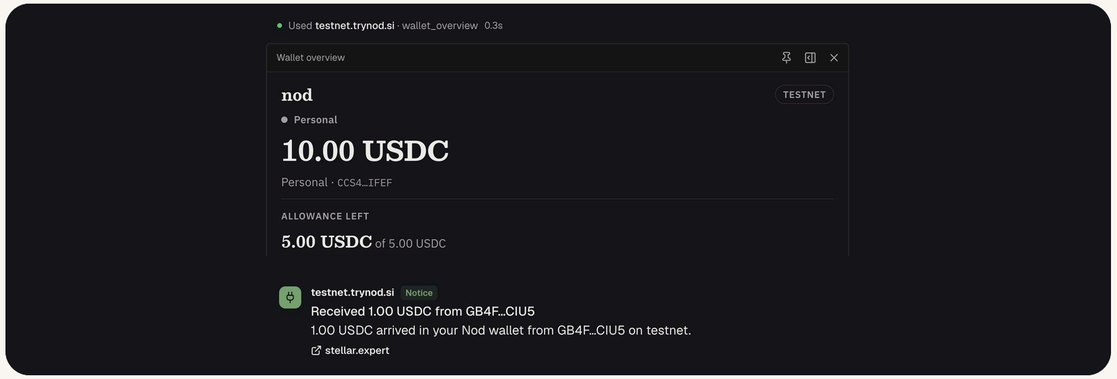

claude.ai: Nod's wallet card, with the one number Claude may spend

claude.ai: past the allowance, the nod is claude.ai's own URL request

ChatGPT, developer-mode connector: the card waits for your passkey

Goblin: the card, and Nod's notice when money arrives (MCP Events)

TECHNICAL EXECUTION

The limit lives on your Stellar account.

Claude, ChatGPT, Goblin, any MCP app

OAuth 2.1 with PKCE; tools, cards (MCP Apps) and events. A connection alone spends nothing.

Nod wallet service

Cloudflare Worker. Holds each app's key, reserves before signing, re-simulates in enforcing mode, pays every fee.

Your OpenZeppelin smart account

```
rule 0 · your passkey · admin and approvals
rule n · Claude's key · ≤ 5.00 USDC until T
```

Circle USDC

Stellar Asset Contract, on mainnet and testnet

A 5.00 allowance spends exactly 5.00. One stroop more is rejected. `c0f6f923`

testnet, spike S1

An over-limit transfer forced onchain is rejected by the account itself. `3daf4b00`

testnet, error #3221, spending limit exceeded

Past the allowance, the passkey signs the payment. The allowance is untouched. `0339b8dd`

mainnet, 5 USDC to Bob with a WebAuthn signature

Revoke removes the rule from the account and sweeps the pocket back. `e17e15d5`

mainnet; the sweep is ab6d493d

Nod pays every network fee. The owner holds 0 XLM. `0.001–0.05 XLM`

per payment on mainnet, relayer as source

TRACK ALIGNMENT · STELLAR COMPOSED

Nine building blocks, one wallet.

OpenZeppelin smart account One contract account per wallet	**OpenZeppelin spending-limit policy** The allowance, N USDC until T	**Passkeys** WebAuthn verifier on the secp256r1 host function
Circle USDC Through the Stellar Asset Contract	**x402 facilitators** x402.org and OpenZeppelin Channels, never our own	**MCP Apps and Events** Cards in the chat, notices by webhook, OAuth connector
SAC trust (CAP-73) Trustline and payment in one transaction	**Deposit router** SAC approve: an exchange-ready G… swept into the wallet (testnet)	**Sponsored reserves** Pockets hold no XLM; relayers pay every fee

> **“Agents that spend: Give an agent a wallet … set its limits with OpenZeppelin's policy library, and let it pay for APIs in stablecoins … over x402 or MPP.”**
>
> Stellar Composed, first idea

> **“No seed phrases, no gas, no jargon. Spending limits … live in the wallet.”**
>
> Stellar Composed, wallets idea

INNOVATION

Four ideas behind Nod.

THE POCKET MODEL

A smart account pays any x402 seller today.

Hosted facilitators reject smart accounts. Claude's key fills its own small account under the policy, in 1 USDC steps, then pays.

`your account` → policy → `pocket` → stock x402 client → `facilitator`

ONE NUMBER AT CONNECT

Connecting an AI app installs its allowance onchain.

The consent page asks one number and your passkey writes it to the account. One rule, expiry and revoke per app.

ASK, DON'T REJECT

Past the allowance, a passkey approval.

Most agent wallets just block it. Nod hands Claude a link, and your passkey signs that recipient and amount, on Nod's page, never in the chat.

CLAIM LINK

Pays people who have never held USDC.

Carol accepts once. The USDC contract's trust function and the transfer run in one transaction.

HACKATHON PROGRESS · 25 OCTOBER, UTC

Built in one day, live on mainnet by evening.

10:55
Research, pinned versions, live probes

11:25
Spec and five spikes, each proven on testnet

12:15
Four build streams on one main branch

13:38
First end-to-end run on the real chain

14:30
Live on testnet with a public URL

17:30
The sandbox moves to testnet.trynod.si

18:00
Live in Goblin: cards, the nod, events

18:05
Mainnet live at trynod.si

18:45
claude.ai: the card and the nod

18:55
The full flow on mainnet, in claude.ai

270+
commits, all on main, from 25 October

8
mainnet transactions in the claude.ai run

3
hosts drawing Nod's cards: claude.ai, ChatGPT, Goblin

0
facilitators of our own

MARKET AND ECOSYSTEM

Every AI app is a door.

Distribution through MCP

Any MCP app connects with one URL: Claude and Goblin today, ChatGPT as a developer-mode connector. Its app store bars crypto transfers for now.

Buyers for Stellar's x402 sellers

Stellar builders have shipped paid APIs and paid MCP tools. They need buyers whose owners will let them spend.

Every payment can onboard someone

Someone who has never held USDC gets a link and creates a wallet with a passkey. Past the allowance, the link is an allowance for that one person: exactly the amount, seven days, its key only in the link (live on testnet).

Live on mainnet

The full flow ran in claude.ai on the founder's own wallet, settled by OpenZeppelin Channels. A payment costs Nod 0.001–0.05 XLM.

TRY IT

Three minutes, in your own Claude.

THE PRODUCT, ON MAINNET

`trynod.si`

THE SANDBOX: 10 TESTNET USDC PER NEW WALLET

`testnet.trynod.si/mcp`

NO CLAUDE? WATCH A SAMPLE AGENT

`testnet.trynod.si/sample`

"Buy the market brief"
0.10 USDC, no prompt; 4.90 left

"Send Alice 2 USDC"
paid on its own; 2.90 left

"Pay Bob 5 USDC for dinner"
More than what is left, so it needs your nod

Full steps in evidence/JUDGE-TEST-PATH.md.

What's next

On mainnet: deposit-first signup, links that create wallets, AI-added contacts (live on testnet)

Recovery passkey and shared wallets

Cash-out through a Stellar anchor

No pocket step once facilitators accept smart accounts

Hardening from our own code audit
